

M-Catalog Platform

Published: June 2003

M-Catalog - A smart choice for your Corporate website e-catalog, e-procurement offerings, e-marketplaces, and much more.

M-Catalog is a service for the creation and hosting of electronic online catalog component. M-Catalog revolutionize the way you build and manage electronic catalogs for your Corporate website, e-procurement needs, B2B transactions, data migration to E-marketplaces and much more.

Before deciding your online plans, ask yourself the following

1. Do you currently have a real electronic catalog?

Many of us mix between DATABASE driven e-catalogs and CDs/PDF Catalogs, and other electronic multimedia illustrations of products and services. Dynamic Electronic catalogs for products are usually built on database platforms. Database structures are essential for handling dynamic data processing including searching, sorting, etc. Furthermore, catalogs based on databases are easily imported, exported and integrated into other electronic systems.

2. Is your catalog ready for E-Commerce, E-Procurement, and other "E" requirements?

A catalog built on a solid database, do not necessarily imply that your product information are ready for E-Marketplace integration, E-procurement and E-commerce. Your catalog structure must comply with industry standards such as BMECat. Further more your catalog must comply with universal classification schemas such as eCL@SS and/or UNSPSC.

3. Do you really need to outsource your catalog component?

You have two options 1) either to generate, maintain and invest in expensive in-house software/hardware infrastructure for building a professional real online E-catalog that fulfill your website needs and other needs related to publishing to third party systems and Marketplaces, or 2) to outsource the "E-catalog"; the most critical dynamic component of your online presence at a fraction of the cost. By outsourcing you no longer worry about the complexity of building, managing and maintaining this most critical component of your online presence.

4. Are you ready for the dynamic online presence?

The issues raised above are minimum prerequisites for joining the dynamic online business. Nowadays, it is essential for many businesses to have the following as a minimum:

- A Database driven product catalog, complying with industry standards for data exchange in order to fulfill E-commerce and possibly E-procurement requirements.
- Solid and centralized infrastructure for hosting and managing product catalogs backed with powerful Databases such as Oracle or MS SQL Server.
- A strong mechanism for publishing your product catalog to E-market places, and possibly to third party E-procurement systems of your business partners.
